	-2-	
4.	Compressed air drills and dynamite were used to loosen the coal. Each mine worked three eight-hour shifts per day the year around. Each shift was compred of about 100 miners. In 1947, production per shift per mine was about 500 tons or one or two freight car loads per day (sic). After the conveyor belts were installed, production increased to seven or eight freight cars per day. In 1952, a mechanical digger and loader was installed in one of the mines. No information was available on how this machine affected coal production. The mine bulletin board showed which mine produced more coal, but it gave no gigures. The freight cars had six wheels, three on each side (sic).	il e
5.	Quarry near Camp Kolerkon Camp Kolerkon was a disciplinary camp situated east of the coal mines (point 18). There was no settlement near the camp. Prisoners were employed in cutting building stone (kirpichnyy kamen) out of the mountain. The stone was cut in sections about 50 x 40 x 20 cm. Prisoners worked in 12-hour shifts. The norm for 24 hours was 50 slabs. These were loaded on cars of the narrow-gauge railroad and sent to Norilsk. The spur of the line came into the camp, crossing the broad-gauge line. The camp had 4,500 inmates of every nationality and a small hospital of some 50 beds was a part of the camp.	
6.	Copper Plant and Camp No. 4 near Norilsk There was a copper plant (mednyy zavod or med-zavod) about four or five km north of Norilsk. The plant was managed by free Russians but operated by prisoners from Camp No. 4 (point 5). This camp held approximately 12,500 prisoners. The plant was not designated by any number. It was served by the broad-gauge railroad. It had two tall smoke stacks about 150 meters high and three or five meters at the base. The plant was run by Grazhdanskiy (fnu).	25X1 25X1
7.	Prisoners entered the plant in brigades of about 30 men. The plant was encircled by a wire fence, four meters high, made of about ten strands of barbed wire. Watchtowers were located along the fence. At night, the fence area was lit up by elect arc lamps, and dogs were tied to running wires every 50 or 100 meters. About 1.5 km inside the wire encirclement, there was a seven or eight-meter-high brick wall which also surrounded the plant. Between these two barriers were small depots of machinery and some barracks or offices.	ric
8.	Camp No. 4 consisted of eight two-story concrete barracks. Seven of the barracks had room for about 1,500 prisoners each. Building No. 8 was a hospital. It had 200 beds and was headed by a woman doctor who was assisted by male prisoners.	
9.	Each camp in the Norilsk area was guarded by a detachment of some 300 soldiers (samokhraniye). The officers wore blue caps with a red band and with or without a red piping around the top. Camps in which source was interned were mostly under the MVD. The only difference between officers and enlisted men's uniforms were the stripes and colors of the shoulderboards.	
10.	Steel Plant South of Norilsk There was a plant south of Norilsk which looked like the copper plant, but which was called the BOF and The plant was situated at the foot of Shmidt Mountain and was connected with both the narrow and broad-railroad lines. About two km from the plant, there was a spur on the narrow gauge line which entered a tunnel, passed through the Shmidt Mountain to a new coal mine which was opened in 1953. The plant was said to receive coal from this mine as well as the coal mines at Kayrkan. Kayrkan coal was delivered by the broad-gauge line. The plant worked the copper-iron ores from the Medvezhka Mines nearby.	
11.	Medvezhka Iron and Copper Mines These were open-pit mines on the Shmidt Mountain. They were worked by prisoners from Camp No. 1, which was situated 1.5 km from each of the mines. The mines did not have a number designation.
